INTRODUCTION

The second edition of the Export Commodity Classification consolidates the many changes made since the introduction of this classification in 1961, and revises the paging to facilitate further changes over the next five years or so. It introduces new information on the period for which each class has been in existence without significant change, and refines information on the former codes applicable to some classes. It also contains a few structural changes, implementing some additional divisions and groups of the parent Standard Commodity Classification, but combining any former one-class groups with other groups.

This edition also shows the codes and descriptions of a number of commodity classes compiled for internal use in the Dominion Bureau of Statistics but which can not be released except to employees of DBS. These classes are marked with the symbol # preceding the class code and also in the "date" column. In all records available to other government officers or the public, such classes are combined with the most appropriate general class within the same commodity group (e.g.: class #400-90 is included with 400-99, class #414-40 with 414-49, etc.).

Nature of the Classification: The Export Commodity Classification (XCC) is based on the Standard Commodity Classification (SCC) which was developed in the Dominion Bureau of Statistics as a tool for integrating statistical series derived from different sources. The XCC is divided into seven "Sections" as follows:

Section I, Live Animals, contains all live animals except live fish and other seafoods shipped for use as food, which are included in Section II.

Section II, Food, Feed, Beverages and Tobacco, contains all other commodities whose chief end use is as food, feed, beverages or tobacco. Because any commodity at one stage of processing is located in only one place in this classification, certain non-food grades of chiefly food commodities (e.g. seed wheat and seed potatoes) are classified in this section, and certain food grades of chiefly non-food commodities (e.g. table salt and vegetable oils) are excluded. Within this section the commodities are further classified by component material and stage of processing.

Section III, Crude Materials, Inedible, contains all commodities whose chief use is as materials for industry, and which have not been processed beyond the stage of cleaning, sorting or concentrating, together with the synthetic equivalents of some natural materials. Waste and scrap materials which are principally used for the same purpose as particular crude materials are included with those materials; other waste and scrap materials are grouped at the end of the section. Within this section the commodities are further classified by component material.

Section IV, Fabricated Materials, Inedible, contains all commodities which have passed the preliminary stages of processing but which are still used chiefly as materials in some later industrial process. Some commodities in this section are highly processed and the chief part of their value may be derived from manufacturing. But all have in common the basic characteristic of materials, i.e., they will be subjected to (or used up in) further industrial operations in the course of which their form will be changed or their identity lost. Within this section the commodities are further classified chiefly by component material.

Section V, End Products, Inedible, contains all commodities which will not lose their identity through further processing, and which are commonly regarded as articles rather than as materials, together with finished identifiable parts, attachments and accessories of these articles. Within this section the commodities are further classified chiefly by principal use or function.

The principles underlying the distinction between fabricated materials and end products can be illustrated by considering the difference between a nail and a needle. The nail is of no use by itself; it becomes useful only in connection with other materials and then it has lost its identity as a nail by being incorporated with those other materials into something quite different from any of them. The needle, on the other hand, is used with other materials but emerges from that use still a needle which is useful again for the same purpose. In this sense the nail is a fabricated material and the needle an end product.

The term "parts" as used in this classification includes only components and assemblies whose end use is quite specific. It does not include such general purpose fabricated materials as nuts, bolts, hinges and other hardware which are classified as such in Section IV unless they form a minor proportion of a mixed invoice of "parts". It also excludes such general purpose end products as motors, bearings or transformers which are separately specified in various classes of Section V. Any export shipment is classified as "parts" only if it consists of a variety of commodities all intended for use in a single assembly and which can not readily be separated, or if its components are not mentioned in the classification.

Parts are treated in either of two ways. In some cases, parts of particular commodities are specified in separate classes in the same group as the commodity, or included in the "n.e.s." class of the group (e.g. 580-, 590-, 600-). In most cases, however, both articles and their parts are included in the same class, and in these cases the class description mentions parts whenever these are known to form a significant part of the class total.

The following table illustrates how particular commodities at different stages of processing are treated in Sections III-V of this classification:

<u>Crude Materials (III)</u>	<u>Fabricated Materials (IV)</u>	<u>End Products (V)</u>
fur skins, undressed	fur skins, dressed	fur coats, gloves
logs	lumber, plywood, millwork	furniture, skis, matches
pulpwood	pulp, paper	books, magazines
fibres, natural or man-made	yarns, piece goods	clothing, rugs, sheets
metals in ores, metal scrap	ingots, wire, hardware	machinery, automobiles

Section VI, Special Transactions - Trade, contains certain essentially commercial transactions which are not, for various reasons, classified by commodity in trade statistics; some export packing, contractors' outfits, and small value shipments. The value of these transactions is included in published totals of Canadian exports.

Section VII, Special Transactions - Non-Trade, contains certain transactions which do not have an international financial implication or which, for various reasons, are better considered separately from merchandise trade in economic analysis; e.g.: gold, settlers' effects and tourist purchases. The value of these transactions is not included in published totals of Canadian trade, but statistics are compiled because they have independent value.

Relation to Other Classifications: Every class, group and division in Sections I-V of the XCC is defined in terms of the SCC, and it is therefore possible to relate export statistics to the SCC and, through it, to other series compiled on the same basis by the Dominion Bureau of Statistics. Sections VI and VII of the XCC are reserved for special transactions which have no exact counterpart in other series (with the partial exception of import statistics), or which, for special reasons, must be excluded from regular totals of Canadian export trade.

There is an especially close relationship between the XCC, which was introduced in 1961, and the Import Commodity Classification (MCC), introduced in 1964. Both classifications retain all the sections and almost all the divisions of the SCC, and

many groups and even classes are identical in all three. Whenever the same commodity code is used in the XCC and the MCC it indicates exact comparability between export and import statistics, except in the case of "n.e.s." classes where exact comparability may require consideration of other classes within the group or sub-group to which the "n.e.s." class relates. There are also many other cases of exact comparability where, for technical reasons, the use of a common code was not feasible; these are indicated by the use of identical commodity descriptions in the two classifications (again with the qualification applying to "n.e.s." classes). The summary of the XCC which follows this introduction (pp. 11-19) can readily be compared with the corresponding summary in the MCC, Vol. I (Cat. No. 12-524, pp. 7-17), or that in the SCC, Vol. I (Cat. No. 12-502, pp. 17-32).

One limitation on the ease of comparing the XCC with the SCC and MCC is applied systematically in this edition. No SCC group or division is treated as a group in the XCC unless it contains at least two XCC classes, and usually more. In cases where exports included in an SCC group permit only one XCC class, that class is included in another XCC group, usually in the same division. This practice was made necessary by the development of additional types of export statistics which can not be published at the commodity class level without identifying the transactions of individual firms.

Availability of Time Series: The last two columns of each page in the body of this classification are intended primarily as aids to persons who wish to obtain past-period comparisons for the classes of the XCC. The first of these columns gives the date on which the class was established with its present content. A class with the same description (and perhaps the same code) may have existed earlier, but before the date shown its content will have been significantly different. Alternatively, the description (and perhaps the code) of the class may have changed one or more times since the date shown, but if so its content did not alter significantly when the description (or code) was changed. The research on which this column is based is still preliminary, and has not been extended before 1919. In cases where the equivalent of a present class existed before January, 1919, the date 1919 is shown in brackets.

The other "comparisons" column shows the code or codes of the classes which included substantially all of the content of a present class immediately before the present code came into use. Whenever two or more former codes appear in this column the class was established with its present coverage on the date shown in the adjoining column. Whenever a former code is starred (*), this indicates that only part of the former class is included in the new class; in these cases also the class was established with its present coverage on the date shown in the adjoining column. When a single unstarred code appears in this column it indicates that on at least one occasion the code of the class was changed without there being a significant change in the content of the class; in these cases the adjoining column shows the earlier date on which the class was established with its present coverage rather than the later date on which the present code was adopted.

In the case of classes for which statistics can not be released, these columns do not contain the usual information. The "date" column shows only the # symbol which indicates that the class can not be released, and the "former code" column shows an = sign and the code of the class which includes the value of the "secret" class in all publications.

Units of Quantity: In preparing this classification, a systematic effort was made to select units of quantity which could readily be reported and which could be made uniform in export and import statistics. As far as possible, uniform units of quantity are used in each group of the classification to facilitate mechanical methods of tabulation. Weight and number are the most commonly used units since one or both of these is normally available for any export or import shipment, but in some cases measures of volume, area or length are used to conform with prevailing industrial practice. Generally, weight is the most common measure of quantity in Sections II, III and IV of the classification, number in Sections I and V. In any case where no other unit of quantity is clearly indicated by the classification, the weight of the shipment should be reported on the B-13 customs entry.

The treatment of parts, attachments and accessories in Section V affects the interpretation of units of number used in this Section. Whenever finished parts, attachments and accessories of a commodity are included with the commodity in a single class, the value of the class covers the total value of all shipments of the commodity including parts, attachments and accessories, but the unit of number refers only to the number of complete units exported. For such classes the average value per unit can not be calculated.

Producers and processors of canned foods have recommended that quantity statistics for these commodities should be in terms of "net weight", i.e. that the weight of all containers, including the cans, should be omitted and only the weight of the contents of the cans shown. This classification attempts to follow that recommendation for all classes which consist entirely of canned products.

In this connection it should be noted that throughout this classification the term "canned" means preserved solely by being shut off from contact with air. It therefore includes all foods preserved by hermetically sealed containers, whether these be made of metal, of glass or of other materials, and also food packed in plastic wrappings and preserved solely by sealing against penetration by air. It does not include frozen foods regardless of the use of hermetically sealed containers since frozen foods are preserved primarily by being frozen rather than by being shut off from contact with air. Likewise foods wrapped and sealed in plastic materials but which must be kept under refrigeration are not included as "canned".

Format: This classification is issued in loose-leaf format, punched to fit any standard 3-ring binder. As revisions are made to the classification, the relevant pages will be reprinted and may be obtained from the Dominion Bureau of Statistics. It is expected that this practice will reduce the need for frequent reprinting of the whole classification.

UNITS OF QUANTITY AND DEFINITIONS USED IN CANADIAN EXPORT STATISTICS

Bbl.	Volume in barrels (for petroleum: 35 Canadian gallons or 42 U.S. gallons).
Broad woven	More than 12 inches in width.
Bu.	Volume in bushels, for barley, 48 lb. for Indian corn (maize), 56 lb. for rye, 56 lb. for buckwheat, 48 lb. for oats, 34 lb. for wheat, 60 lb.
Canned	Preserved solely by being shut off from air (see also discussion on p.8).
Carat	Weight in carats.
Cord	Volume in cords.
Cwt.	Weight in hundredweights of 100 lb. each.
Cwt. N.	For canned foods, weight of contents of cans in hundredweights of 100 lb. each, the weight of all containers and packing being excluded (see also discussion on p.8).
Domestic exports ..	All exports wholly produced in Canada, and also all exports of previously imported goods which have been changed in form by further processing in Canada.
Doz.	Number of dozens.
Doz. Pr.) Dz. Pr.)	Number of pairs in dozens.
Ft.	Length in linear feet.

331 - Lumber is rectangular-sawn (and sometimes dressed) to standard sizes. Lumber thicknesses and widths are generally at 1" intervals from 1" up (from $\frac{3}{4}$ " up in the case of dressed lumber). Lumber lengths are often mixed, but are usually multiples of 1', and rarely less than 6'. Some typical dimensions for lumber are:

2" x 4" x 8'	1" x 6" x 10'
2" x 10" x 12'	8" x 8" x 12'

Exclude sawmill products (334-), other wood fabricated materials (339-). See notes for these other groups.

Alloy Steel means any steel containing any one or more of the following elements in the following amounts:
manganese, 1.65% or more; silicon, 0.50% or more; copper, 0.60% or more; aluminum, chromium, cobalt, columbium, molybdenum, nickel, titanium, tungsten, vanadium, zirconium, in any significant amounts.
Carbon and alloy steel may be distinguished by the following specification numbers or type designations:
Carbon steelA.I.S.I. or S.A.E. Nos. 1000 to 1329
Stainless steelType 201 to 546
Other alloy steel ...A.I.S.I. or S.A.E. Nos. 1330 to 9850

WIDTH AND THICKNESS DEFINITIONS FOR STEEL BARS, PLATES, SHEET AND STRIP

Note: The higher the gauge number the thinner the steel. Gauge #7 or higher is always sheet or strip.
For lower gauge numbers the classification depends on width as well as thickness.

	Width	Thickness		
		Decimals	Fractions	Gauge
Bars	8" or less	over 0.2030"	13/64" and over	#5 or lower
Plate	over 8" not over 48" over 48"	over 0.2299" over 0.1799"	15/64" and over 3/16" and over	lower than #4 lower than #7
Sheet and strip	8" or less over 8" not over 48" over 48"	0.2030" & less 0.2299" & less 0.1799" & less	3/16" and less 7/32" and less 11/64" and less	#6 or higher #4 or higher #7 or higher

* 447 - 06 Structural shapes are finished steel sections, of various shapes, with dimensions of width, thickness and depth.
Exclude parts of prefabricated buildings and structures (941-).
